

Evidence News 05/10 – 23rd June 2010AD

WELCOME to the best bits Evidence News for June 23rd 2010. Latest exposure on Sea Level rises plus a new dinosaur flood find as well as the great news that our Down Under Jurassic Ark Outdoor Creation Museum and fossil dig site stage 1 is almost complete (click below for details). Now enjoy the articles with EDitorial COMment from John Mackay and the world wide team at Creation Research.

JURASSIC ARK STAGE 1 NEARS COMPLETION see what's happening click [HERE](#).

Also see the first panel of the Genesis Mural erected June 2010 click [HERE](#).

Evidence News comes to you in PDF format so you need Adobe Reader which is freely available from <http://www.adobe.com>.

This week's Evidence News **Index** follows - to view the entire e-news please click <http://www.creationresearch.net/enews/ENEWS0510-100623.pdf> (if the link doesn't work just copy and paste it into your web browser).

- 13. CRIKEY! CROCS GO SURFING**
- 14. DONATIONS TO HELP CREATION RESEARCH WORLDWIDE**

1. TWO WEEKS OF FOSSIL TRIPS IN US: October 11-15 or 18 -22nd 2010. Book now for a week of wonderful Bible teaching and fossil tripping in Tennessee's magnificent Cumberland Plateau in October. Join John Mackay, Robert Stewart and Robert Powell for the real evidence on Noah's flood and Creation. *Cost:* 1 person \$160, married couple \$280, married couple with one child \$350; with two children \$400, with three children \$450, four or more children \$500 (maximum cost). *Contact Email:* clcstaff@cedarlakecamp.org. *Find Registration Form:* www.cedarlakecamp.org (go to the "Camps" page and find the OCTOBER link).

2. YOUR LAST CHANCE TO JOIN the Great Aussie Outback Creation Tour and see Lake Eyre which is predicted to be at its fullest since Europeans arrived, as well as see the evidence of God's handiwork and judgement set in a backdrop of glorious outback beauty blessed by rain and abundant wildflowers. Click [HERE](#) for details.

3. ANOTHER DINOSAUR FLOOD CATASTROPHE, according to an article in the Canadian Globe and Mail 17 June 2010. Scientists in Alberta Canada have found an enormous bone bed containing thousands of horned dinosaurs and concluded the animals were wiped out by a catastrophic tropical storm-flood scenario. The bone bed is near Hilda, 50 km north of Medicine Hat and covers an area of 2.3 square kilometres (0.9 square miles), making it the largest dinosaur bone bed documented so far. David Eberth, a senior research scientist at the Royal Tyrrell

Evidence News 05/10 – 23rd June 2010AD

Museum explained: “Data from this mega bone bed provide pretty clear evidence that these and other dinosaurs were routinely wiped out by catastrophic tropical storms that flooded what was once coastal lowland here in Alberta, 76 million years ago.”

He went on to say: “It's unlikely that these animals could tread water for very long, so the scale of the carnage must have been breathtaking. The evidence suggests that after the flood, dinosaur scavengers trampled and smashed bones in their attempt to feast on the rotting remains.” The museum scientists claim the bone bed indicates that the plant-eating horned dinosaur named *Centrosaurus apertus*, lived in large herds. They also claim it explains why there are so many dinosaur fossils in the badlands of Western Canada. Ebert commented: “Not only can we now explain why these kinds of horned dinosaurs are preserved in such great abundance here, but the tropical storm model also explains why there are so many kinds of dinosaurs preserved in the rocks at Dinosaur Provincial Park, the Drumheller area, and even Grande Prairie, and why they are often found preserved so exquisitely.”

Globe and Mail: <http://www.theglobeandmail.com/news/technology/science/alberta-scientists-discover-largest-bed-of-dinosaur-bones/article1608423/>

ED. COM. Another local flood eh? Explains why so many dinos in Alberta Badlands eh? They are getting close eh? As someone who has wandered much through Canadian and USA badlands dino deposits, this editor suspects they will eventually find fossil shark teeth, turtle bones etc. also occur in much of the badlands deposits, all of which indicate a flood of far bigger proportions than one which covered a few sq kilometres. Perhaps if we reminded them that no tropical storm, even a hurricane, has ever been observed to bury that many large animals it might help, or would the underlying anti- Noah's Flood bias built into geology since the time of Lyell and Darwin, stop them admitting it still? You decide. (Ref. deluge, cataclysm, reptiles)

4. HIDDEN DNA CODE FOUND, according to articles in *Nature*, vol. 465, p45 and ScienceDaily, 6 May 2010. When the human genome was completely sequenced, geneticists only found around 20,000 genes, but studies of cellular processes in different body tissue indicated there was much more genetic information being used to make the body function. The solution to the problem seemed to lie in the fact that genes consist of multiple segments that can be used in different combinations. For genetic information to be used, a working copy of the whole gene is made on a molecule named pre-messenger RNA. The segments of code needed for a particular purpose are then cut out of this and spliced together to form messenger RNA, which is sent to the cellular machinery to be used to make a protein.

Brendan Frey and Benjamin Blencowe of the University of Toronto have developed a computer-assisted biological analysis method to find “biological rules” within the genome that control this mixing and matching process. This “splicing code” means that many different messages can be generated from the same information stored on each gene. Therefore, a relatively small number of genes can provide enormous amounts of information needed for all the complex functions of the body. For example, the researchers suggest “three neurexin genes can generate over 3,000 genetic messages that help control the wiring of the brain.” When the splicing code is fully understood it may help medical scientists predict or prevent diseases such as cancers and nerve cell destroying disorders like Alzheimer's and Parkinson's diseases.

Frey explained: “Previously, researchers couldn't predict how the genetic messages would be rearranged, or spliced, within a living cell. The splicing code that we discovered has been successfully used to predict how thousands of genetic messages are rearranged differently in many different tissues.” Frey and Blencowe's project involved close collaboration between biologists and computer scientists. Frey commented: “Understanding a complex biological system is like understanding a complex electronic circuit. Our team 'reverse-engineered' the splicing code using large-scale experimental data generated by the group.”

ScienceDaily: <http://www.sciencedaily.com/releases/2010/05/100505133252.htm>

ED. COM. Neat eh? Like having a 26 letter alphabet that can be spliced together in different ways to make words which can then be spliced together in different combinations to make instruction

sentences all organised from outside the alphabet. But did you see it – this study exposes the biggest problem for origin of life studies: the genetic letters are not the information and the genetic words are not the information, so where did the genetic information to put them into the so important final genetic instruction sentences come from - originally? Observing how it functions and even describing it does not answer this question. You want a clue – information is always the product of mind – not matter. (Ref. design, complexity, bio-informatics)

5. ORIGIN OF LIFE ENERGY PROBLEM described in an article in ScienceDaily, 25 May 2010. The origin of life has been described as a chicken and egg problem, where scientists can't work out what came first – the ability to reproduce or the ability to control chemical reactions (metabolism). Both are needed for life. Scientists at the University of Leeds have now pointed out another necessity for life – a controlled source of energy. However, this leads to yet another chicken and egg problem. Cells use a molecule named ATP to transfer chemical energy, but this requires enzymes (large proteins that act as catalysts) to make. Terry Kee of the University of Leeds explained: "You need enzymes to make ATP and you need ATP to make enzymes. The question is: where did energy come from before either of these two things existed?" The P in ATP is phosphate – a combination of phosphorous and oxygen. ATP gives out energy when a phosphate ion is removed from it, and regains the energy when a phosphate is re-attached. In this way it acts like a rechargeable battery, undergoing cycles of discharging and recharging, as phosphates are attached and detached. Kee and his colleagues at the University of Leeds have studied chemical reactions involving phosphorous-containing compounds and concluded: "We think that the answer may lie in simple molecules such as pyrophosphite which is chemically very similar to ATP, but has the potential to transfer energy without enzymes." But scientists who study the origin of life are not sure where phosphorous containing molecules came from in the first place. One theory is they came from meteorites. Kee commented: "Phosphorus is present within several meteoritic minerals and it is possible that this reacted to form pyrophosphite under the acidic, volcanic conditions of early Earth."

ScienceDaily: <http://www.sciencedaily.com/releases/2010/05/100525094906.htm>

ED. COM. Kee's description of the chicken and egg problem of needing both energy and enzymes for the origin of life is a serious problem for those trying to explain the origin of life by naturalistic processes. Finding molecules like pyrophosphite does not really help because these molecules do not exist in living things. You cannot explain the origin of life until you can explain the origin of the real molecules that actually do occur in living cells.

Furthermore, the energy and enzyme problem is not the only chicken and egg problem in the origin of life. The most serious problem is how the genetic code came into being. Genetic code is stored on DNA, but DNA itself cannot be made without the enzymes it codes for. In fact, none of the genetic code can be used for any purpose without the coexistence of a lot of complex cellular machinery consisting of proteins and many other large molecules, along with the controlled energy sources referred to by Kee and colleagues. The Leeds University research only confirms that the origin of life requires the plan and purpose of an intelligent Creator who devised the genetic code and at the same time made the cellular machinery to use it and the energy source to power it all. (Ref. biochemistry, abiogenesis, nucleotides)

6. OBAMA'S HOMOSEXUAL PRIDE MONTH decreed, according to a Presidential Proclamation issued 28 May 2010. Barrack Obama has declared the June 2010 to be Lesbian, Gay, Bisexual, and Transgender Pride Month. In the proclamation praising the contributions to society made by Lesbian, Gay, Bisexual, and Transgender (LGBT) Americans he wrote: "Much work remains to fulfil our Nation's promise of equal justice under law for LGBT Americans. That is why we must give committed gay couples the same rights and responsibilities afforded to any married couple, and repeal the Defense of Marriage Act." Obama also wants to change the law to secure adoption rights for "LGBT Americans," and stated: "I am also committed to ending "Don't Ask, Don't Tell" so patriotic LGBT Americans can serve openly in our military, and I am working with the Congress and our military leadership to accomplish that goal."

Proclamation: <http://www.whitehouse.gov/the-press-office/presidential-proclamation-lesbian-gay-bisexual-and-transgender-pride-month>

ED. COM. Obama may have been voted the legal authority to set up or repeal laws in a USA which was created by the acts of men, but Obama has no authority to re-define marriage which was created by an act of the God who made human beings as male and female, and proclaimed marriage to be the union of one man and one woman (Genesis 1:26-27, 2:24). This is affirmed by Jesus Christ who stated “at the beginning the Creator 'made them male and female', and said, 'For this reason a man will leave his father and mother and be united to his wife, and the two will become one flesh'” (Matthew 19:4-5). Obama may occupy the most powerful human office in the world, but one day he will have to answer to the One who really does have all authority in heaven and earth (Matthew 28:18), for this Creator Jesus Christ is coming again to judge the living and the dead and He totally disapproves of gay behaviour. On that day the democratic vote will count for nothing! (Ref. politics, America, sexuality)

7. RISING SEA LEVEL SURPRISE, according to a report in ABC (Australia) News in Science 3 June 2010 and *Global and Planetary Change* online 21 May 2010. Arthur P. Webb of Pacific Islands Applied Geoscience Commission, Fiji and Paul Kench of School of Environment, The University of Auckland, New Zealand have studied aerial photos of 27 islands taken between 20 and 60 years ago and found 80 percent of the island had remained stable or increased in size. The results surprised those who believe Pacific Islands were doomed to disappear below global warming induced sea level rise. The researchers still believe sea levels are rising but the islands can keep up with it or even outgrow it. Kench commented: “Some of those islands have gotten dramatically larger, by 20 or 30 percent. We've now got evidence the physical foundations of these islands will still be there in 100 years.”

Island growth is due to a number of processes. In their article the researchers wrote: “Results contradict existing paradigms of island response and have significant implications for the consideration of island stability under ongoing sea-level rise in the central Pacific. First, islands are geomorphologically persistent features on atoll reef platforms and can increase in island area despite sea-level change. Second, islands are dynamic landforms that undergo a range of physical adjustments in responses to changing boundary conditions, of which sea level is just one factor. Third, erosion of island shorelines must be reconsidered in the context of physical adjustments of the entire island shoreline as erosion may be balanced by progradation on other sectors of shorelines.”

ABC: <http://www.abc.net.au/science/articles/2010/06/03/2916981.htm>

ED. COM. Who would have believed it? Al Gore certainly never suggested it and Prince Charles and the Archbishop of Canterbury still haven't spotted it. There remains no excuse for the sea level rise scare tactics being used by politicians to introduce new save the earth taxes to increase their powerbase. Instead, we should be studying the earth, learning to live with the changes that are occurring, use the resources wisely and reminding ourselves that the earth will be sustained by its Creator until it pleases Him to bring it to an end. (Ref. climate change, geomorphology, Oceania)

8. HONEYCOMB ENGINEERING REVEALED in a report in *PNAS*, vol. 107, p9502, 25 May 2010. The geometrical structure of honeycomb has long been recognised as superb engineering. The hexagonal structure makes a light but strong structure. However, natural honeycomb has been discovered to have strength, flexibility and tolerance of temperature changes that the geometry alone cannot explain. Researchers from the College of engineering, Peking University and School of Engineering Cardiff University have studied the microstructure of natural honeycomb and subjected it to tension and shear tests over a period of two years from when it was first laid down. After the comb is first constructed, bees continually reinforce it with thin layers of wax and silk recycled from cocoons of hatched larvae, creating a strong composite material. The researchers suggest strong artificial materials could be developed that use both the geometry and composite nature of natural honeycomb. They wrote: “Artificial engineering honeycombs mimic only the macroscopic geometry of natural honeycombs, but have yet to achieve the microstructural sophistication of their natural counterparts. The natural honeycombs serve as a prototype of truly biomimetic cellular materials with hitherto unattainable improvement in stiffness, strength, toughness, and thermal stability.”

ED. COM. Do the engineers who studied honeycomb structure stop to think how it came to be invented? Do they think the bees, with their pinhead brains, thought it up? To design/copy and build a “truly biomimetic cellular material” will require many engineers’ brains and computers. Forgive us for repeating the obvious – but if the engineers succeed they will have proof that it took creative intelligence to design the wax and silk and program which bees follow to make the honeycomb structure. (Ref. insects, bio-engineering)

9. OLDEST PELICAN SURPRISES SCIENTISTS, according to reports in BBC news 11 June 2010 and Journal of Ornithology, published online 28 May 2010. French fossil researchers have found a well preserved fossil of a pelican, complete with large beak, in early Oligocene limestone in Luberon, southeastern France dated at 30 million years old, making it the oldest known pelican. The bird was a little over one metre long from tail to beak and had a wingspan of about two metres. The researchers were surprised by how much the fossil bird resembled living pelicans. Antoine Louchart University of Lyon, who studied the fossil, commented: “It is remarkably similar morphologically to the seven species of living pelican, but its proportions differ slightly from all of them, so it probably represents a distinct species.” He went on to say “It shows an example of stasis, or no morphological change, in the skeleton, although perhaps changes in other characteristics occurred, such as plumage or behaviour.” Louchart also notes that other flying creatures, such as bats, have remained unchanged for about 50 million years.
BBC: http://news.bbc.co.uk/earth/hi/earth_news/newsid_8733000/8733503.stm

ED. COM. Stasis – hasn’t changed – stayed the same – didn’t evolve - produced its own kind! Can’t say it can they! This fossil is a fully formed pelican, with all the distinctive features of pelicans and it is evidence that pelicans have always been pelicans and show no signs of having evolved from or into anything else. No surprise to us, but we accept that the Creator, who made the first pelican, clearly stated in Genesis that flying creatures were made according to their kinds and all our observations confirm that such living creatures actually do behave in this fashion – they reproduce after their kinds. (Ref. aves, equilibrium, fossilisation)

10. OLDEST JET PROPULSION FOUND, according to BBC News and *Nature* 465, pp427 and 469, 27 May 2010. Palaeontologists at the University of Toronto and Royal Ontario Museum have studied a mysterious fossil creature originally found amongst the Burgess Shale fossils in Canada in 1976. Since then 91 fossils of the creature have been found and it has been identified as a cephalopod – a soft bodied animal like an octopus or squid. It has been named *Nectocaris pteryx* and is a kite shaped creature with external gills, two tentacles at its front end, eyes with well developed lenses located on short stalks, and below these a nozzle-like funnel. The Burgess shale is dated as 505 million years old, so this creature is the oldest cephalopod on the evolutionary timetable, and puts the origin of cephalopods back about 30 million years. The creature did not have an external shell, so it challenges the theory that cephalopods without shells evolved from nautilus-like creatures with shells, which in turn evolved from crawling shelled creatures. The researchers state in the report: “The presence of a funnel suggests that jet propulsion evolved in cephalopods before the acquisition of a shell. The explosive diversification of mineralized cephalopods in the Ordovician may have an understated Cambrian ‘fuse’.”

A “News and Views” article in *Nature* is illustrated with photos of a living octopus, a space shuttle launch rocket and an artist’s reconstruction of *Nectocaris pteryx*, with the caption pointing out that these are all equipped with nozzles for jet propulsion. The article contains this statement: “Cephalopods, uniquely among animals, have invented directed jet propulsion by the effective use of a funnel, or siphon, through which water can be expelled from a body cavity at high speed and in any direction.”

BBC: http://news.bbc.co.uk/2/hi/science_and_environment/10173293.stm

ED. COM. Did you notice that the writers of *Nature* News and Views cannot avoid using the language of creation when describing the origin of jet propulsion, i.e “have invented”. However, octopuses and squids are well understood today and none have the ability to invent jet propulsion systems any more than present day space rockets invented their propulsion system.

This fossil also shows that there is nothing simple or half-formed about any Burgess Shale creature. They have the same complex features seen in creatures that are alive today. The fact that most of them are extinct does not mean they evolved into other creatures. It does indicate there has been significant degradation of the environment causing many creatures to die out. The researcher's comment about "understated Cambrian fuse" is another way of saying there is no evidence these creatures, shelled cephalopods and present day cephalopods evolved from anything else.

All living and fossil cephalopods are fully formed functional creatures, with each kind having its own unique combination of features which fits well into the Biblical history of the world, and provides no evidence for evolution. (Ref. molluscs, invertebrates, design)

11. BURGESS FOSSIL DATES as Vance Nelson visited the site high in the Canadian Rockies and reports back that the fossils are listed as "505 MYO" at the Walcott quarry site; but at the visitor's centre fossils are "515 MYO" inside, but outside the visitor's centre the same fossils are "530 MYO" Vance recalls "I didn't realize I was walking soooo slowly". (Ref. Dating, Age, Cambrian)

12. UNCHANGED FOSSIL FIG WASP FOUND, according to reports in ScienceDaily 15 June 2010, and Fossil Science 16 June 2010. Steve Compton, of University of Leeds, and colleagues have identified the oldest known fossil fig wasps among specimens originally collected from the Isle of Wight in the 1920s. The wasps had been incorrectly identified as ants, but the mistake was noted by the late Mikhail Kozlov who was carrying out research at the Natural History Museum, London into the flora and fauna of the Isle of Wight. Compton's team compared the fossils with modern day fig wasps and found they were almost identical. Like their living counterparts the fossil wasps had pollen pockets on their undersides and these contained fig pollen, indicating the wasps were actively pollinating fig trees just as they do today. The fossils have been dated at 34 million years old. Compton commented: "What makes this fossil fascinating is not just its age, but that it is so similar to the modern species. This means that the complex relationship that exists today between the fig wasps and their host trees developed more than 34 million years ago and has remained unchanged since then." He went on to say: "We believe from molecular evidence that fig wasps and fig trees have been evolving together for over 60 million years. Now we have fossil confirmation that gets us a bit closer to that date. Although we often think of the world as constantly changing, what this fossil gives us is an example of something remaining unchanged for tens of millions of years - something which in biology we call 'stasis'." The reports also note that figs are tropical fruits and do not grow in the Isle of Wight today.

ScienceDaily: <http://www.sciencedaily.com/releases/2010/06/100615191649.htm>

Fossil Science:

http://www.fossilscience.com/research/Worlds_oldest_fig_wasp_fossil_proves_that_if_it_works_do_not_change_it.asp

ED. COM. The word "stasis" means to stay the same. The fact that the fossil pollen could be identified as fig pollen means figs have stayed the same as well. Therefore, this fossil is not evidence that "fig wasps and fig trees have been evolving for 60 million years." It is evidence that wasps and figs have reproduced after their kind, just as Genesis says about both plants and animals. If you want to ponder a bit – it also means the cold windy un-tropical Isle of Wight, was once Figgily warm. (Ref. Fruit, climate, insect)

13. CRIKEY! CROCS GO SURFING, according to articles in Nature News and ScienceNOW 7 June 2010 and ScienceDaily 8 June 2010. A team of researchers which originally included the late Steve Irwin (also known as the "Crocodile Hunter") have studied the way estuarine, or saltwater, crocodiles move around the waterways and coasts of northern Australia. The team tagged and tracked 27 adult crocodiles and also analysed data from previous tracking studies. They then compared the crocodiles' journeys with records of currents and tides. They found the crocodiles regularly travelled distances of around 50km along rivers and out into the open ocean.

Evidence News 05/10 – 23rd June 2010AD

When travelling in rivers and estuaries the crocodiles began long journeys within an hour of the tide changing and when the current was against them they moved onto the riverbank or dived to the river bottom. By comparing the crocodiles' movements at sea with surface ocean currents the researchers concluded crocodiles were also able to make use of the currents that were flowing in the right direction. One male crocodile made a 590km journey from the Kennedy River down the west coast of Cape York Peninsula. This took 25 days and coincided with a seasonal current system that develops in the Gulf of Carpentaria. Another crocodile travelled more than 400 km from the east coast of Cape York Peninsula through the Torres Straits to the Wenlock River on the west coast of Cape York. During the 20 day trip it waited in a sheltered bay for four days and only passed through the Straits when the currents were flowing in the right direction. Scientists have long wondered how the one species of the estuarine crocodile, *Crocodylus porosus* could have spread over many islands and coasts across an area extending from India and China to northern Australia to the Fiji islands in the Pacific even though they are not strong swimmers. This tracking study indicates the crocodiles 'surf' the ocean currents.

Hamish Campbell from University of Queensland, one of the researchers, explained: "The estuarine crocodile occurs as island populations throughout the Indian and Pacific Ocean, and because they are the only species of salt-water living crocodile to exist across this vast area, regular mixing between the island populations probably occurs. Because these crocodiles are poor swimmers, it is unlikely that they swim across vast tracts of ocean. But they can survive for long periods in salt-water without eating or drinking, so by only travelling when surface currents are favourable, they would be able to move long distances by sea. This not only helps to explain how estuarine crocodiles move between oceanic islands, but also contributes to the theory that crocodilians have crossed major marine barriers during their evolutionary past."

ScienceDaily: <http://www.sciencedaily.com/releases/2010/06/100607092136.htm>

ED. COM. This study does confirm previous anecdotal evidence of such river crocodiles being seen in the open ocean, and is a clue to how such animals survived Noah's flood and spread out to colonise the newly formed continents and islands following the flood. It also confirms that since the crocodiles are all the same species, this study contributes nothing to the theory of evolution. (Ref. reptiles, crocodilians, migration)
