3. NEW QUESTIONS:

NEANDERTHAL MAN? Did these species exist and when? There are many scientific evidences on these species. What evidence do you have and could you briefly explain their existence.

[ANSWER](#) by John Mackay

GENESIS DAYS? A Bible Study guide book arranges the six days of creation described in Genesis 1 as two parallel groups of three, with the first three telling us God made the different parts of the creation, and the second three showing us what he made to function within each of the three parts. Does this structure show Genesis is not real history, but a poetic account about God's power and orderliness?

[ANSWER](#) by Diane Eager

SYMBOLIC? Surely Genesis is just a symbolic account of creation with the chief point being God did it.

[ANSWER](#) by John Mackay

4. NOTABLE QUOTABLE on using Genesis: "Bibles are really essential for reaching Myanmar people of other faith. They want the whole Bible not just a New Testament, because the Creation story in Genesis is always the turning point from their Buddhist ideology." Rev Saw Shwe, Chairman Bible Society of Myanmar, May 2013.

ED. COM. Those who hand out New Testaments to today's generation of students in western countries should note this advice. Thanks to secular education authorities a whole generation has grown up in the west knowing nothing more of God as Creator than Buddhists in Myanmar.

5. UK CREATION SCIENCE MUSEUM REOPENS as Ross Rosevear writes... "We closed at Christmas 2009 so the mezzanine floor could be built in the next two months. But repairs to our old (if still prestigious) building became all too necessary. A plethora of authorities added difficulties and demands... The devastating effect of evolution theory is blatant in our society in education and the media. Arguments against such atheism – yes, lots in the displays."

Creation Research has donated fossils to this museum. We encourage you to go see it when visiting Portsmouth UK. For more information [click](#) then EXPO

6. "OLDEST APE SHEDS LIGHT ON HUMAN EVOLUTION" is the headline of an article in ABC News in Science 16 May 2013 about two fossils found in the East African Rift Valley and described in *Nature* DOI: 10.1038/nature12161 15 May 2013. The ABC article begins: "The discovery of the 25.2 million-year-old fossilised partial jaw and tooth suggest tectonic movement could have played a role in human evolution, say researchers." The fossils were found in the western branch of the Great Rift Valley that runs from the Red Sea down through east Africa. The researchers believe the rift began forming by tectonic movement around 25 million years ago – much the same time as the ape lineage split from Old World Monkeys (e.g. baboons, macaques, mandrills).

The new fossils were found in a layer dated as 25.2 million years old, making them the oldest ape and Old World Monkey fossils so far found. One of the fossils is a piece of a jawbone with four teeth attached that has been identified as being an ape, and given the name *Rukwapithecus fleaglei*. The other is a single tooth with a fragment of jawbone attached. This has been identified as belonging to an Old World Monkey, and has been named *Nsungwepithecus gunnelli*. Eric Roberts, a geologist of James Cook University in Queensland, Australia, commented: "The fossils provide a link between the earlier primates and the later group that gave rise to apes and humans." Because of the location of the fossils in the rift valley, Roberts also suggested the movement of tectonic plates helped shape human evolution. According to Roberts, "When you change the landscape you are creating different environments and creating a situation that favours evolution and diversification." Link: [ABC](#)

ED. COM. Did you notice how the story evolved? Scientists began with two jaw fragments and finished with tectonic plate movements giving rise to human beings. Amazing how big an evolutionary story can be built on such small fragmentary fossils? In case you didn't notice the missing links between the two ends of this story, they are 1) a pre-existing belief that Old World Monkeys and apes evolved from a common monkey ancestor; 2) a belief that change in the environment resulting from tectonic movements can manufacture any genes needed to change a monkey into an ape; and 3) a belief that apes turned into people. So what does the evidence really show? The monkey tooth was identified as such because it looks like a monkey tooth. The piece of ape jaw was identified as belonging to an ape for the same reason – it looks like a piece of ape jaw. This certainly does indicate that monkeys and apes have been monkeys and apes ever since these fossils were buried, however long ago scientists believe that to be. The only truly logical conclusion you can draw from the total evidence found is that monkeys and apes have multiplied after their kinds, just as Genesis tells us. (Ref. anthropology, primates)

7. EARTH WET WHEN MOON FORMED, claim scientists in articles in *New Scientist* and *Nature News* 9 May 2013, *ABC News in Science* 10 May 2013, and *Science* DOI: 10.1126/science.1235142 9 May 2013. Ever since water was found combined in moon rocks, in the 1970s, scientists have wondered where it came from. Water on the earth is theorised by some to have come from asteroids named carbonaceous chondrites, but acquiring water this way is claimed to take a long time and the current theory of the origin of the moon does not give it enough time to get water this way.

The moon is believed to have formed from molten material ejected from the early earth when a proto-planet named Thaeia collided with it some 4.5 billion years ago. Any water and gases should have boiled away and vaporised off. For any water or hydrogen to be included in moon rocks it must have been delivered before the moon solidified – a process that could have occurred in only one month. According to Alberto Saal of Brown University, Providence, Rhode Island the water “had to come from the only thing that we know had water: the Earth.”

Saal and colleagues from two other American universities studied the ratio of different hydrogen isotopes in volcanic glass melt inclusions trapped in olivine crystals in Moon rocks collected by the Apollo astronauts. They found “lunar magmatic water has an isotopic composition that is indistinguishable from the bulk water in carbonaceous chondrites and similar to terrestrial water, implying a common origin for the water contained in the interiors of the Earth and Moon.”

The next question is: how come the early earth had enough water to give some to the moon? The current evolutionist theory of earth formation is that it coalesced from materials in a swirling nebula that became the sun and solar system. The moon-forming impact is believed to have occurred only 100 million years after the earth solidified. However, the earth is too close to the sun to have retained any water that may have been in the nebula material, and 100 million years is not enough to have acquired a so much water from meteorite strikes. Saal claims: “The implication, although I cannot absolutely prove it, is that probably the Earth formed with water.” To get around the problem of the early earth being too close to the sun to retain water *New Scientist* reports: “Saal thinks that Earth may have formed near where the asteroid belt is now, which is far enough from the sun for water to condense. The planet would then have migrated inward.”

According to *Nature News*: “the isotopic match between Earth and lunar water and carbonaceous chondrites supports a startling theory about the evolution of the inner Solar System, Saal says.

According to this theory, known as the 'grand tack' model, the youthful planet Jupiter temporarily migrated into the inner Solar System, destabilizing the orbits of water-rich carbonaceous chondrites, which originally resided farther out than the birthplace of Jupiter and Saturn. As a result, some of the bodies could have fallen inwards and become part of the raw material for making Earth and its neighbours." Links: [ABC](#), [Nature News](#), [New Scientist](#)

ED. COM. In amongst these convoluted theories of asteroids, proto-planets and migrating planets there is a grain of truth – the earth had water when it was formed. How can we be sure? The Creator, who made the earth, moon and planets, specifically told us in Genesis 1:1-5. If scientists, who weren't there, took notice of the Creator, who was there, they would have no need for such contorted ever changing stories about Jupiter and Earth migrating in and out, and a proto-planet whose existence is as mythical as the goddess it is named after.

These scientists are actually fulfilling a prophecy given by the Apostle Peter nearly 2000 years ago who wrote that "scoffers will come" and "deliberately forget that long ago by God's word the heavens came into being and the earth was formed out of water and by water." (2 Peter 3:3-5) (Ref. astronomy, solar system, planets)

8. OLDEST WATER DISCOVERED, according to articles in Nature News 15 May 2013 and *Nature* vol. 497, p357 16 May 2013. A team of Canadian and British scientists claim to have found water that has been preserved in rocks deep in the earth's crust for between 1.5 and 2.67 billion years. This makes it the oldest water so far found. The water was found deep in a copper and zinc mine in the Timmins, Ontario area of the Canadian Precambrian Shield.

The scientists estimated the age of the water using isotopes of Xenon combined with theories of what the earth's atmosphere was like in the past, assuming the water had preserved a record of fluid chemistry and environmental conditions at the time it was isolated in the rock. As well as xenon and other noble gases, the water also contains hydrogen and methane, and the researchers are now studying it to see if it could support life. If so, the researchers suggest: "The discovery that ancient fluid environments capable of supporting life can remain isolated for hundreds of millions to billions of years may require changes in our understanding of the extent of the Earth's crust that may be habitable, and the part that such potential buried biomes play in preserving, evolving and propagating life on planetary timescales." The finding has implications for the search for life on Mars, which has "tectonically quiescent geologic terrains" similar to Precambrian shields on Earth. The researchers suggest that "similar potential buried biomes may be preserved at depth in the subsurface of Mars on planetary timescales."

Link: [Nature News](#)

ED. COM. Amazing! A leap of faith from water in a Canadian mine to life evolving on Mars. Earth-bound scientists have yet to find any life in this water, let alone on Mars. It is possible there are bacteria living in this water, but if scientists do find any that will only prove bacteria can survive in water deep within rocks. It will not prove it evolved there. Water and chemicals alone cannot make life, on earth or Mars. To make life you need information to organise basic chemicals into the more complex chemical components of the living organisms, as well as much more information to put these together in the correct way. Such information does not come from chemicals. It is only known to come from the mind of an intelligent Creator. (Ref. ground water, geochemistry, abiogenesis)
