

CREATION RESEARCH NEWS

WOT A WEEK WE'VE HAD as Diane Eager arrives back in Oz from the UK Whitby conference bearing Burmese Cretaceous fossil amber containing feathers, our Museum Building Manager Des and wife Linda return home bringing a great Jurassic flood fossil showing mixed land and sea creatures. Meanwhile UK Joe and Sarah-Ann's baby is anxious to arrive plus USA Dirt Doc Glen Wilson is fully recovered from his op and running a successful Holiday Club in Tennessee. Martin Legemaate, Canada Museum director, sends fantastic fossil human pics from Pompei. Back at home Craig and Derek continue their successful Creator King Ministry tour down through NSW, and sadly Anne Mackay had a bad fall after church last Sunday. So lots to pray for praise for as we share His Word and work around the globe - to God be the glory great things He has done!

AUSTRALIAN DINGO DECLARED A SEPARATE SPECIES by Australian University joint studies at ANU, QUT and UA in a report reproduced by many media sources based on genetic studies and on extinct fossil dingoes found in China. Sadly the evolutionists are so keen to promote 'the origin of the species' they overlook the obvious - dingoes cross breed with imported dogs all the time and the most famous example of this is the fabulous Aussie Cattle Dog, the Blue Heeler. Differences are so minor they are no hindrance to cross breeding at all. It is no surprise then to find dingoes across the world from Oz to America because they migrated with people after Babel. Check out the Carolina dog or come to our Aussie Museum and see them all in our new Aboriginal display end of August. Environmentalists are also trying to push for the dingo to be a protected species. As one farmer said to us: 'There goes my farm if we are no longer allowed to kill wild dingoes that attack our sheep and calves'. The debate over the classification of dingoes has been going on for many years. See our report Dingo Species Dispute [here](#).

GREAT AUSIE FLOOD SPECIMEN GAINS for our museums as we have acquired famous fossil specimens from an old collection which were first found at Yea in Victoria. They were considered the world's oldest land plant and named after the then Director of the Geological Survey Victoria who had the very Cornish name of Baragwanath and listed as 425 million years. But a notable quote below from the current Museum of Melbourne site shows the fossilized plant is just another living fossil in the Tassel fern/clubmoss family washed out to sea and buried by rapid flooding – no help to evolution or millions of years. In the specimens shown above spot the strata the plants were buried in. All these land plants found to date are torn apart and the strata are considered as marine and bear a distinct similarity to the flood strata we produce in our strata machine.

USA: Tax deductible cheques to 45 Rooney Lane, Hartsville to Creation Education Society

Quote from the Melbourne museum:

“Baragwanathia fossils are usually found as pieces of stem between 10 and 50 cm in length with long narrow leaves arranged in spirals around the stem. The stems are often only visible as iron-stained impressions in rocks. When it was alive Baragwanathia would have looked very similar to its modern relatives, club-mosses and tassel-ferns, but was much larger, growing up to 2 m long with a sprawling form.

Baragwanathia plants were washed into sea which covered most of Victoria.”

A VERY WET WHITBY CONVENTION this year, but a blessed time none the less, as over 40 people came to dig fossils, learn the truth about the rocks, spend time in Bible studies, and learn from an international speaker panel during the evening seminars. Despite the complete washout with the weather (welcome to British summertime), the activities and teachings were well received, as were the wide range of teachings. Creation Research speakers Joseph Hubbard, Dr Diane Eager, and John Mackay were joined by AiG's Simon Turpin & Neil Seeds, evangelist and mollusc expert Simon Terry, and Professor Andy McIntosh, covering a range of topics from Adam to fossils, Aussie aboriginals to slugs and snails, and mutations to fungus.

The fossil finds were a true blessing as well, with an abundance of living fossils, such as timber (including the famous Whitby jet), which is a southern conifer, still alive today in Oz! Other fossils included spectacular ammonites, pecten shells, and beautiful fossil ferns (pics below) Attendees were taught how to recognise flood fossils and rocks, and how the living fossils challenge evolution since all they have shown is 'reproduction after their kind!'

WATCH THE LATEST CREATION CONVERSATIONS special program with John Mackay sharing to UK convention attendees on BRAND NEW COAL, OIL AND GAS RESEARCH from Jurassic Ark! <https://www.youtube.com/live/9iWr3RJw-MM?si=3cYEFg93jPksvSF>

ARRIVED DOWN UNDER - GREAT UK MIXED FOSSIL SLAB for our Aussie Museum showing deep-sea Ammonites and petrified Pine wood buried together from the UK's Jurassic Coast. Wonderful evidence of flooding that washed pine trees out to sea, mixed them with deep sea Ammonites, then buried them before the soft wood rotted.

DONATE ARTIFACTS AND FOSSILS NOW. Send to Creation Research, PO Box 260, Capalaba, QLD 4157.

UK PRAYER NEED as UK Director Joseph Hubbard writes: My wife Sarah-Ann and I are prayerfully and nervously awaiting the arrival of our first daughter, due literally any minute as I write this! Some minor concerns which have taken us in and out of hospital most days this past week, but things are looking good now, so join us in prayer as we wait to meet this new blessing that the LORD has given us! A big thank you to new UK worker Steve who will be holding the fort at the UK museum project and ministry while I take some much needed time off to support Sarah-Ann and move into this new ministry that God has called me to - fatherhood, knowing that the LORD will raise the funds needed to do so. Thank you to all those who support the ministry as it enables us to support workers like Steve, and allows me to work full time in Creation Research. Times are still very tight in ministry, so we really are grateful for any and all support to Creation Research. Continue to partner with us in this ministry as we are now really beginning to see an impact with the museums around the world!

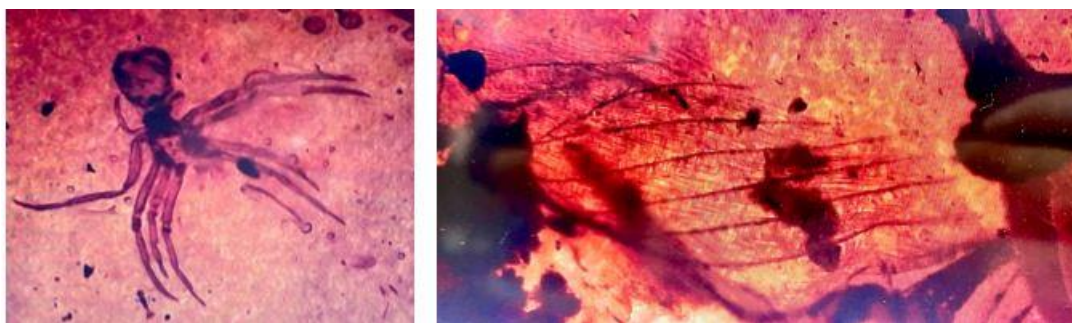

DON'T MISS THE CREATION GUY at Bonah Church of Christ date 27 July 5:30 pm. Must book via Jeanette 0400 659 458 or Fran 0427 631 965.

THURSDAY CATCH CRAIG HAWKINS IN GLOUCESTER NSW by hooking up to the Tasmanian Creation Discovery Centre Facebook page.

USA REPORT as The Dirt Doc (Glenn Wilson) is fully recovered from an op and has been able to scuba dive for the first time since getting certified in April. The trip to a local lake saw Glen stick to the shallows and look for fossils in the submerged coal and slate deposits and he took home a lot of geodes from one location.

He and his wife Ruby have been serving their church's Vacation Bible School each night this last week (15th-19th) which over 100 kids attended. They played the parts of Mary and her nosy neighbour Ethan in a skit that showed how Jesus is preparing a heavenly home with room enough for everyone who trust Him as Saviour. CR-USA continues to produce weekly radio broadcasts on creation that can be heard live on WDEB Jamestown, TN (103.9) at 8:30 CT or accessed anytime at the CreationResearchUSA.org website under the Media/Soul Science Segment page.

SOME GREAT FOSSILS NOW IN OUR AMBER COLLECTION: The evolutionists love to claim the fossil bird feathers above are actually from dinosaurs despite no evidence of dinosaurs in the amber.

Living Fossils in Australian Amber

LIVING FOSSILS IN AUSTRALIAN AMBER. Scientists at Monash University have been studying pieces of amber found in a former coal mining region in south-eastern Australia. The amber is dated as 42 million years old and contains preserved insects, springtails and spiders. It was found in 2014 and first described in the scientific literature in 2020. Further research using an x-ray scanning technique has enabled scientists to see more detail even in thick almost opaque pieces of amber. The most significant finds are the first fossils of two species of midges and a wasp to be found in Australia. Fossil of these insects have been found in other parts of the world but living examples are now only found in Australia.

The fossils in the amber are exactly the same as the creatures now living in Australia. The researchers commented: “Without realising it, we exist among living fossils. While we know these species were widely distributed in the past, today most of them are found only on this continent.”

ED. COM. These scientists may have only just realised we live among living fossils, but living fossils are everywhere, and Creation Research has been proclaiming this for decades. (Our first documentary video was entitled “The World of Living Fossils”.) The term “living fossils” was coined by Charles Darwin to describe living things that are identical to their fossils. Classic examples are horseshoe crabs, the nautilus, coelacanth, and Wollemi Pine. Darwin and other evolutionists consider them to be anomalies, but the reality is all living things that are also found in the fossil record are living fossils, unchanged from whenever the fossils were buried until the present. As such they are confirmation of Genesis 1, where God states 10 times He created living things according to their kinds. No matter how old these scientists believe the amber fossil insects to be, the presence of identical living insects shows they have multiplied after their kinds since they were trapped in the amber.

The comment that the insects found in the amber used to be widespread throughout the world but now only live in Australia, is another confirmation of Biblical history – the world is going downhill, not evolving upwards. The world started out very good, with a widespread pleasant climate and lush environment. Therefore animals and plants would have been more evenly spread throughout the world. Ever since Noah’s Flood there have been creating extremes of climate and degeneration of the

Creation Research News Email Update 23rd July 2024

environment, resulting in many creatures dying out or becoming restricted to smaller regions- a reminder the real history of the world is from Good to Bad to Worse.

See many examples of Living Fossils in our museums, including the Living Fossil Forest at our Jurassic Ark outdoor museum site, planted right next to the fossil trees including Araucaria logs, plus see our beautiful seashells, fish and Ginkgo leaves in our museums in Oswestry UK, Beauty Point Tasmania Australia, Brisbane Australia and Canada.
